

Handheld Connectivity

In today's business, information flows are more complicated by the explosive growth in new devices, applications, technologies and communications media, as well as increasing geographical diversification and employee mobility. Asavie's solutions, built on a unified connectivity platform, accelerate the secure exchange of information between people, applications and devices, wherever they are located. They eliminate traditional deployment cycles, reduce system management requirements and operational costs, and provide unlimited flexibility.

Connect Any Device

Whether providing access to line of business applications or personal information management, Asavie integrates any device with your enterprise networks. As there is no client software to install, the network is future-proofed allowing newly released devices to be connected without delay. With no requirement to maintain client software on devices, day to day operations are simplified and a wider range of devices can be supported.

Drive Operational Efficiencies

With real-time access to applications and information, staff productivity is significantly increased as the business operates in real-time. Mobile workers can respond instantly to business events from their handheld device. Information accuracy and workflows are enhanced as field operatives and mobile staff have direct access to business applications.

Policy Compliance

With Asavie Handheld Connectivity, devices can be locked down to prevent direct internet access. Restricting internet access ensures that mobile devices are not used inappropriately and provides for consistent application of corporate security policies. Policies may also be applied to block or limit data usage when devices roam onto foreign networks*.

Complete Connectivity

Asavie provides the complete solution to address current and future needs by enabling access from a wide range of devices and by constantly adding support for new technologies and devices. With the capability to scale to tens of thousands of devices, the service can accommodate changing business demands with an assured platform.

**Home Operator Network Dependent*

At a glance:

- Connect any mobile device to the enterprise
- Dramatically reduce the cost of network integration and control of handheld devices
- Instant private 3g data network
- Extend enterprise applications and services to mobile devices
- IP level connection that is transparent to applications
- Scalable and assured service
- No device software required
- Extend corporate policies to mobile devices

TECHNICAL HIGHLIGHTS

Full Connectivity to Network

Full IP connectivity ensures that applications on mobile devices have a transparent connection to the enterprise network. Secured connectivity is enabled simply by configuring the Asavie Access Point (APN) on the mobile device without deploying network software on the device.

Easy Enterprise Integration

Connectivity with the enterprise network is enabled by installing the Asavie software agent which requires no changes to network topology or opening of inbound firewall ports. IP addresses can be assigned from an enterprise defined pool greatly simplifying the integration of mobile subnets.

Handset Productivity

Asavie greatly simplifies the integration of mobile handsets with key enterprise services such as file shares, web applications and Microsoft Exchange services. This extended access is delivered to handset users within a single security domain and without opening any inbound firewall ports.

Rapid Device Setup

Supported devices may be configured over-the-air using SMS reducing configuration errors and simplifying the device deployment process. Where large numbers of devices are being provisioned, device and user information may be bulk-loaded to speed implementation and reduce implementation errors.

Access Control and Security

Asavie Handheld Connectivity supports consistent application of enterprise security policies. Access controls may be applied to individual devices, groups and even the complete network. Devices accessing the service are authenticated and authorised for access using both device credentials and device/SIM number. Device credentials can be authenticated by the service or enterprise services such as RADIUS and Active Directory.

About Asavie

Asavie is the leading provider of on-demand solutions that accelerate the secure exchange of information between people, applications and devices. Asavie's purpose-built and proven unified connectivity platform delivers seamless connectivity, regardless of network, technology and location. Asavie solutions maximise information availability, ensure the security of information exchange, and optimise operational efficiency.
